

Pricing-To-Market and Networks

December 22nd, 2017

CIGS

Serguey Braguinsky (Maryland/NBER/Osaka)

Daisuke Miyakawa (Hitotsubashi)

Tetsuji Okazaki (Tokyo)

1-1. Introduction

- Currency exchange rate \Rightarrow export price measured in X (e.g., *yen*)

E.g.,

$$\log(\mathbf{yen\ export\ price}) = \alpha + \beta \log(\mathbf{yen/USD}) + \varepsilon$$

$\Rightarrow \beta \doteq 0$ (i.e., complete pass-through)

$\Rightarrow \beta \doteq 1$ (i.e., no pass-through \Rightarrow profit margin might be altered)

- “Incomplete” pass-through: $\beta \neq 0 \Leftrightarrow$ Pricing-to-Market (PTM)

- Export dynamics (e.g., disconnect puzzle: macro)
- Market structure (industry)
- Firms’ pricing behavior (micro)

Q. What determine(s) the level of β ?

1-2. Introduction

- Well known **“incomplete”** pass-through phenomenon
 - Gopinath et al. (*AER* 2010), Nakamura & Steinsson (*AER* 2012)

- Potentially many firm-level **“heterogeneity”**
 - Price level: Melitz & Ottaviano (*RES* 2008)
 - Market share Atkeson & Burstein (*AER* 2008)
 - Product quality: Baldwin & Harrigan (*AEJ-Micro* 2011)
 - Import intensity & market share: Amiti et al. (*AER* 2014)

- Less than **“ideal”** data for examining specific mechanisms
 - Aggregate data or unit value computed from custom data are used...
 - Exception? Goldberg & Verboven (*RES* 2001): Automobile, Nakamura & Zerom (*RES* 2010): Coffee, Fitzgerald & Haller (*RES* 2014): “Plant-product”

2. This paper

In practice, different counts are considered as different products (e.g., In modern clothing, dress shirt: 40-120 count, casual shirt: 20-80 count)

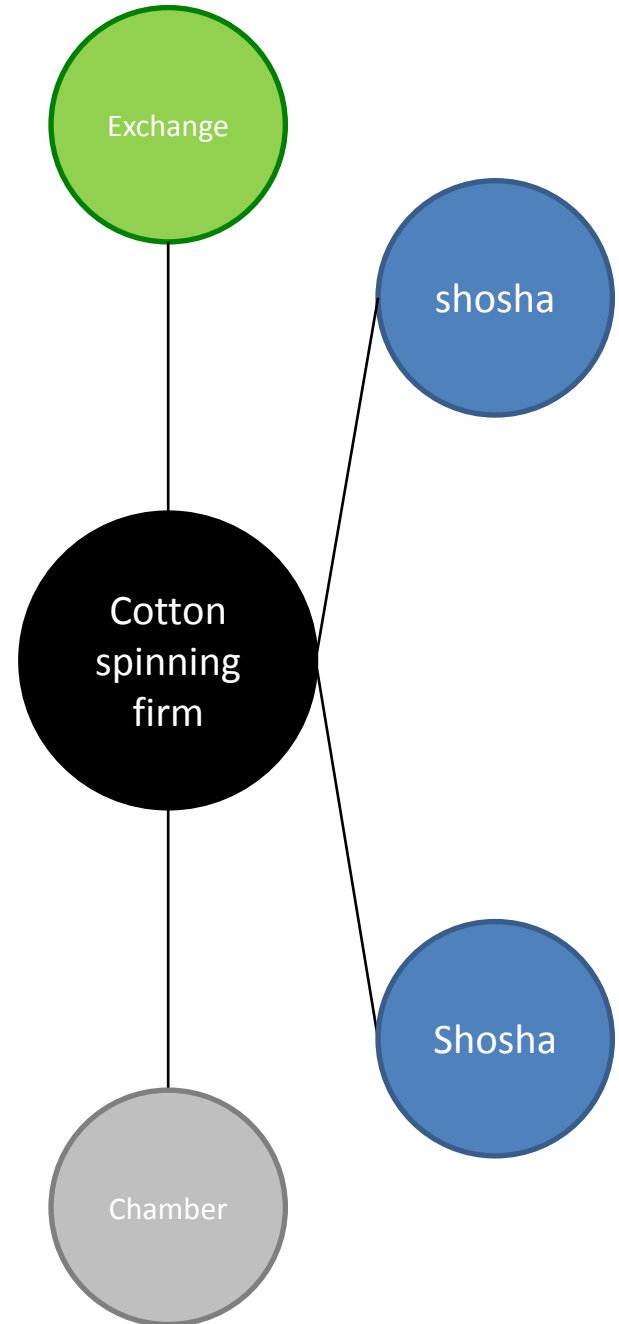

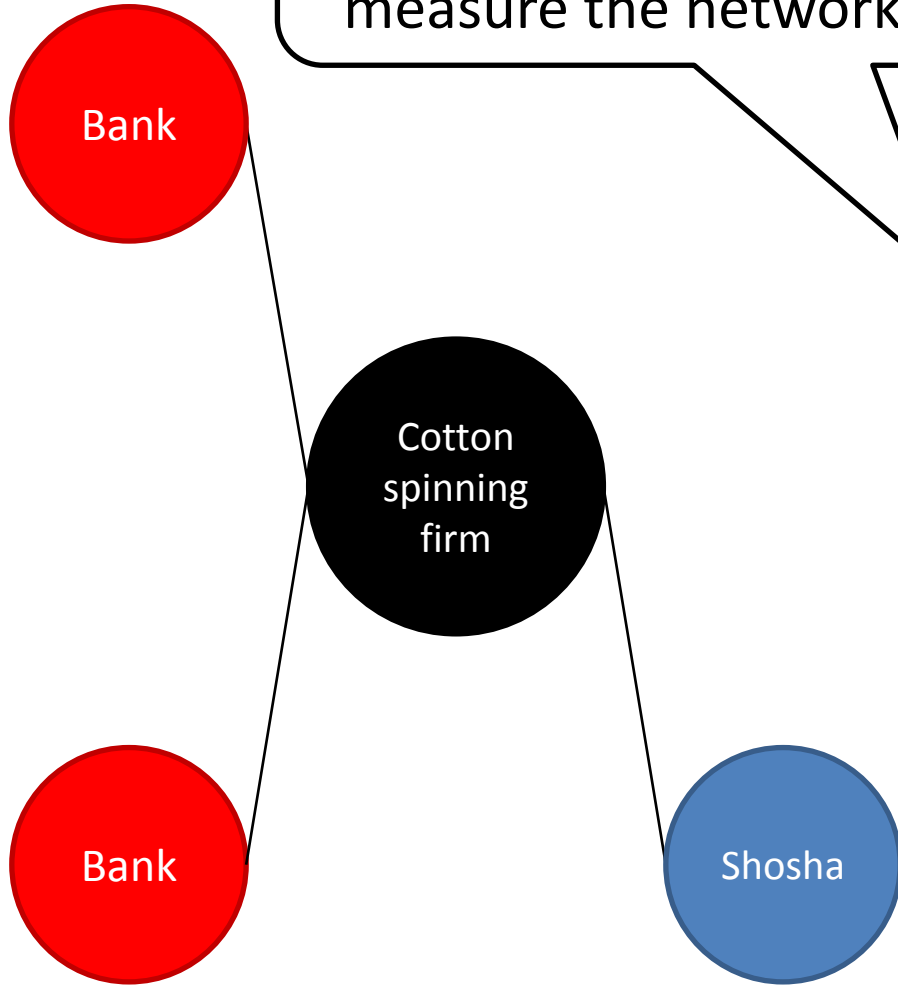

□ Use ideal data

- **Narrowly defined & differentiated** product
- Cotton yarn in a specific count: “16-bante”
 - ⇒ Even better than Fitzgerald & Haller (2014): SIC 8 digit-level (E.g., 22810302: COTTON YARN, SPUN)
 - ⇒ Exported to one common market (i.e., Shanghai)
- **High frequency** (monthly) **firm-level export price** data
 - ⇒ Allows panel estimation to control for unobservable factors
- **Exogenous currency exchange rate dynamics** under the gold standard in Japan and the silver standard in China (i.e., destination country)
- Use a **comprehensive list of firm attributes** (Braguinsky et al. *AER* 2015)

□ Study the association b/w β & one untouched channel:

↔ **Networks (esp. shosha) held by cotton spinning firms**

We use the board member identities to measure the networks

3. Key takeaways

- Low unconditional pass-through rate (↔Fitzgerald & Haller 2014)
- Pass-through depends on...
 - TFP, firm size, import intensity, labor skill (↔Product quality), as in the extant studies

- Pass-through also depends on **“network”** factor ...
 - **Tight connection with “shosha” increases pass-through**
↔ Might reflect the actual price setting pattern in reality

⇒ **First analysis** employing **ideal price data** to pin down **network factor** with controlling for a list of comprehensive firm attributes

4-1. Literature: “Mark-up”

□ Larger β when...

■ Lower price (\Leftrightarrow higher TFP: Melitz & Ottaviano *RES* 2008;
Berman et al. *QJE* 2012)

■ Higher market share (Atkeson & Burstein *AER* 2008)

■ Higher product quality (Baldwin & Harrigan *AEJ-Micro* 2011)

← Lower demand elasticity

\Leftrightarrow Higher mark-up elasticity \Leftrightarrow Lower pass-through

4-2. Literature: “Marginal cost”

□ Larger β when...

- Higher import intensity of intermediate goods (Amiti et al. *AER* 2014)
- Central product (Chatterjee et al. *AEJ-Policy* 2013)
- Higher local distribution cost share (Corsetti & Dedola *JIE* 2005)
- Higher productivity (Berman et al. *QJE* 2012)

← Higher marginal cost elasticity

↔ Higher elasticity of home currency-measured price

↔ Lower pass-through

4-3. Literature: Some new angles...

□ Employ some of them jointly...

■ Amiti, et al. (*AER* 2014): (i) Firms w/ larger market share and/or (ii) firms w/ higher import intensity shows larger mark-up dynamics (\Leftrightarrow lower pass-through)

□ Attempting to claim something new...

■ Financial constraint: Strasser (*JME* 2013): Financially constrained firms pass-through the change in exchange rate more \leftarrow Critique in Gopinath (*JME* 2013)

5-1. Data: Firm-month export price

- ❑ Hand-collected from industry report (*Geppo*: 大日本紡績連合会月報)
- ❑ Monthly frequency firm-level export price data
- ❑ 1897/5 ~ 1898/6, 1901/10, 1902/4 ~ 1903/12, 1911/6 ~ 1914/12

⇒ Note: The gold standard was introduced in 1897

⇒ Note: Periods associated with major events (e.g., The Boxer Rebellion, Japan-Russo war) are excluded

- ❑ Firm ID, count-level (e.g., 16, 20, etc.) export price

- For each firm × count, we have max (highest reported prices in each month), min (lowest in each month), avr (average price in each month)

- Mainly 16 and 20 count data are available (also 10, 12, and 14)

- Price information from China and Indian producers are also available

- ❑ Domestic price (製糸十六番手一梱平均代価)

- ❑ Export quantity (16 and 20 count: converted to 梱数)

- ❑ Many missing data on export quantity (even when prices are reported)

- ❑ Mumbai price is also partially available

Note: 22, 23, 24, 30, 32, 40, 41, 42, 60, and 80 counts were actually produced

雲龍魁玉の類には一匁高を以て當地紡績筋に數千俵先物約定出來たる爲め各銘物にも一般一二匁高直相場を示し従て質棉も五匁方騰貴を見るに至れり通州物南北雜牌類にも一般在荷薄の事なれば氣配強氣を含み尙一段上進もせざらん現況なり

今本日の出來直を上れば左の如し

| 品銘 | 出來直 | 品銘 | 出來直 |

5-2. Data: Currency exchange rate

- Data book of Japanese economic statistic (日本経済統計総観)
- Monthly frequency *yen/ryo* (Chinese currency) exchange rate
 - Highest, lowest, average (used in our analysis) for each month

5-3. Data: Firm characteristics

□ Firm characteristics

■ *Geppo* & financial statement (考課状)

■ Items included in the data

- Output: Measured in physical units for two machinery (ring & mule)
- Capital: Two-types of machinery, operating hours & days, power source
- Labor: Male & female w/ wage information
- Intermediate good: Cotton & coal
- Cotton sources: Japan, China, India, US, HK, Vietnam, Egypt, others
- Product composition: Share of 16 & 20 counts out of total production
- Location: All the plants (with detailed information)
- Almost all the P/L & B/S items (e.g., inventory, sales)
- Board member managers' attributes (e.g., education)
- Plant-level attributes, entry/exit (firm & plant) ⇒ Planning to use...

Note: Production data are handled to compute TFPQ by following Braguinsky et al. (AER 2015)

⇒ At most, 32 firms × 57months (max #obs = 517 in the current analysis)

5-4. Data: Summary stat (a) - (c)

| Variable | Definition | Obs | Mean | Std. Dev | Min | Max |
|--------------------------------|--|-----|------|----------|-------|------|
| Sample (a): Sample for Table 2 | | | | | | |
| <i>P</i> | Natural logarithm of Yen(i.e., home currency)-measured 16-bante cotton exported | 436 | 4.67 | 0.16 | 4.05 | 5.08 |
| <i>ER</i> | Exchange rate measured as units of yen per one ryo | 436 | 0.21 | 0.08 | 0.06 | 0.35 |
| <i>TFP</i> | Firm-level total factor productivity obtained from fixed-effect panel estimation | 436 | 0.00 | 0.13 | -0.36 | 0.45 |
| Sample(b): Sample for Table 3 | | | | | | |
| <i>P</i> | Natural logarithm of Yen(i.e., home currency)-measured 16-bante cotton exported | 353 | 4.67 | 0.16 | 4.46 | 5.08 |
| <i>ER</i> | Exchange rate measured as units of yen per one ryo | 353 | 0.22 | 0.07 | 0.06 | 0.35 |
| <i>TFP</i> | Firm-level total factor productivity obtained from system GMM estimation | 353 | 0.00 | 0.12 | -0.33 | 0.34 |
| Sample(c): Sample for Table 4 | | | | | | |
| <i>P</i> | Natural logarithm of Yen(i.e., home currency)-measured 16-bante cotton exported | 353 | 4.67 | 0.16 | 4.46 | 5.08 |
| <i>ER</i> | Exchange rate measured as units of yen per one ryo | 353 | 0.22 | 0.07 | 0.06 | 0.35 |
| <i>TFP</i> | Firm-level total factor productivity obtained from fixed-effect panel estimation | 353 | 0.01 | 0.13 | -0.33 | 0.45 |
| <i>WAGE</i> | Natural logarithm of female worker wage | 353 | 0.00 | 0.29 | -0.49 | 0.58 |
| <i>SIZE</i> | Natural logarithm of output | 353 | 0.06 | 1.14 | -2.48 | 2.68 |

Note: All the variables other than IMPORT is demeaned

5-5. Data: Summary stat (d)

Sample(d): Sample for Table 5

| | | | | | | |
|------------------|--|-----|-------|-------|--------|-------|
| <i>P</i> | Natural logarithm of Yen(i.e., home currency)-measured 16-bante cotton exported | 189 | 4.68 | 0.17 | 4.51 | 5.08 |
| <i>ER</i> | Exchange rate measured as units of yen per one ryo | 189 | 0.21 | 0.07 | 0.06 | 0.35 |
| <i>TFP</i> | Firm-level total factor productivity obtained from fixed-effect panel estimation | 189 | 0.02 | 0.13 | -0.31 | 0.43 |
| <i>WAGE</i> | Natural logarithm of female worker wage | 189 | 0.06 | 0.28 | -0.43 | 0.53 |
| <i>SIZE</i> | Natural logarithm of output | 189 | 0.26 | 1.23 | -2.48 | 2.68 |
| <i>IMPORT</i> | Import from Ryo export source countries / Import from all the souces (Note: this variable is time-invariant and measured as of the initial appearance in the data) | 189 | 4.46 | 20.60 | -39.67 | 39.23 |
| <i>INVENTORY</i> | (Inventory + Account receivable) / Sales | 189 | -0.01 | 0.08 | -0.09 | 0.26 |
| <i>RATE</i> | BOJ's discount rate | 189 | -0.15 | 0.64 | -1.05 | 1.14 |
| <i>SHARE</i> | Output share of 16 count cotton yarn | 189 | 0.02 | 0.24 | -0.42 | 0.55 |
| <i>CAPUTIL</i> | Capuital utilization rate | 189 | -0.01 | 0.14 | -0.41 | 0.51 |

5-6. Network data

□ Coded data

■ Shosha & trade exchange

- 1893-1918

■ Bank, chamber of commerce

- 1893, 1894, 1895, 1898, 1900, 1901, 1907

□ Merge the following items to our cotton yarn firm-level panel data

■ Count the number of overlapped board members

■ Time-invariant as of 1898 & time-variant for shosha

5-6. Network data

□ E.g., Amagasaki

6. Bring it to estimation

Focus on the observation with some price change
(\Leftrightarrow Nakamura & Steinsson 2012)

(i) Fixed-effect panel estimation:

$$\ln P_{i,t} = \alpha + \beta_1 \ln ER_t + \beta_2 x_{i,t} + \beta_3 \ln ER_t \times x_{i,t} + FE_i + \varepsilon_t$$

(ii) Allison's hybrid random-effect estimation (Allison 2009)

$$\begin{aligned} \ln P_{i,t} = & \alpha + \beta \ln ER_t + \gamma_1 (x_{i,t} - \bar{x}_i) + \gamma_2 \bar{x}_i \\ & + \delta_1 \{ \ln ER_t \times x_{i,t} - \overline{\ln ER \times x_i} \} + \delta_2 \overline{\ln ER \times x_i} + RE_i + \varepsilon_t \end{aligned}$$

(iii) Correlated coefficient random-effect estimation (Wooldridge 2010)

$$\begin{aligned} \ln P_{i,t} = & \alpha + \beta \ln ER_t + \gamma_1 x_{i,t} + \gamma_2 \bar{x}_i \\ & + \delta_1 \ln ER_t \times x_{i,t} + \delta_2 \overline{\ln ER \times x_i} + RE_i + \varepsilon_t \end{aligned}$$

7-5. Robustness

- Asymmetry b/w appreciation & depreciation
- Incorporate other currencies
- Incorporate prefectural controls
- Incorporate and consider additional factors:
 - Interaction b/w exchange rate & centrality of 16 count: (+/-) but insig
Interaction b/w exchange rate & 1(early entry to export market): (+) but insig
↔ Early entrant has some market power
 - Interaction b/w exchange rate & 1(headquartered in Tokyo): (+) but insig
↔ Distribution cost as in Berstein & Jaimovich (2012)?
 - Exclude the periods for WWI (July 1914~)

⇒ Results in “full model” are robust to the inclusion of these items

8-1. Discussion

- Somewhat stable (-) coef associated w/ shosha*ER
 - Under depreciation of JPY, firms with higher “shosha” increases yen-price by smaller margin
 - This leads to lower ryo-price (\Rightarrow more export “quantity”)
 - Note: This is the case with many controls proposed in literature

- Possible mechanism?
 - Intention to increase market share?
 - Intention to gain more profit from transaction?

8-2. Things to be done

- Better to confirm the robustness of this result
 - Construct longer bank/kaigisho member list

9. Conclusion

- Use the ideal data and confirm heterogeneous pass-through in a comprehensive way: Product quality, import, financial cost

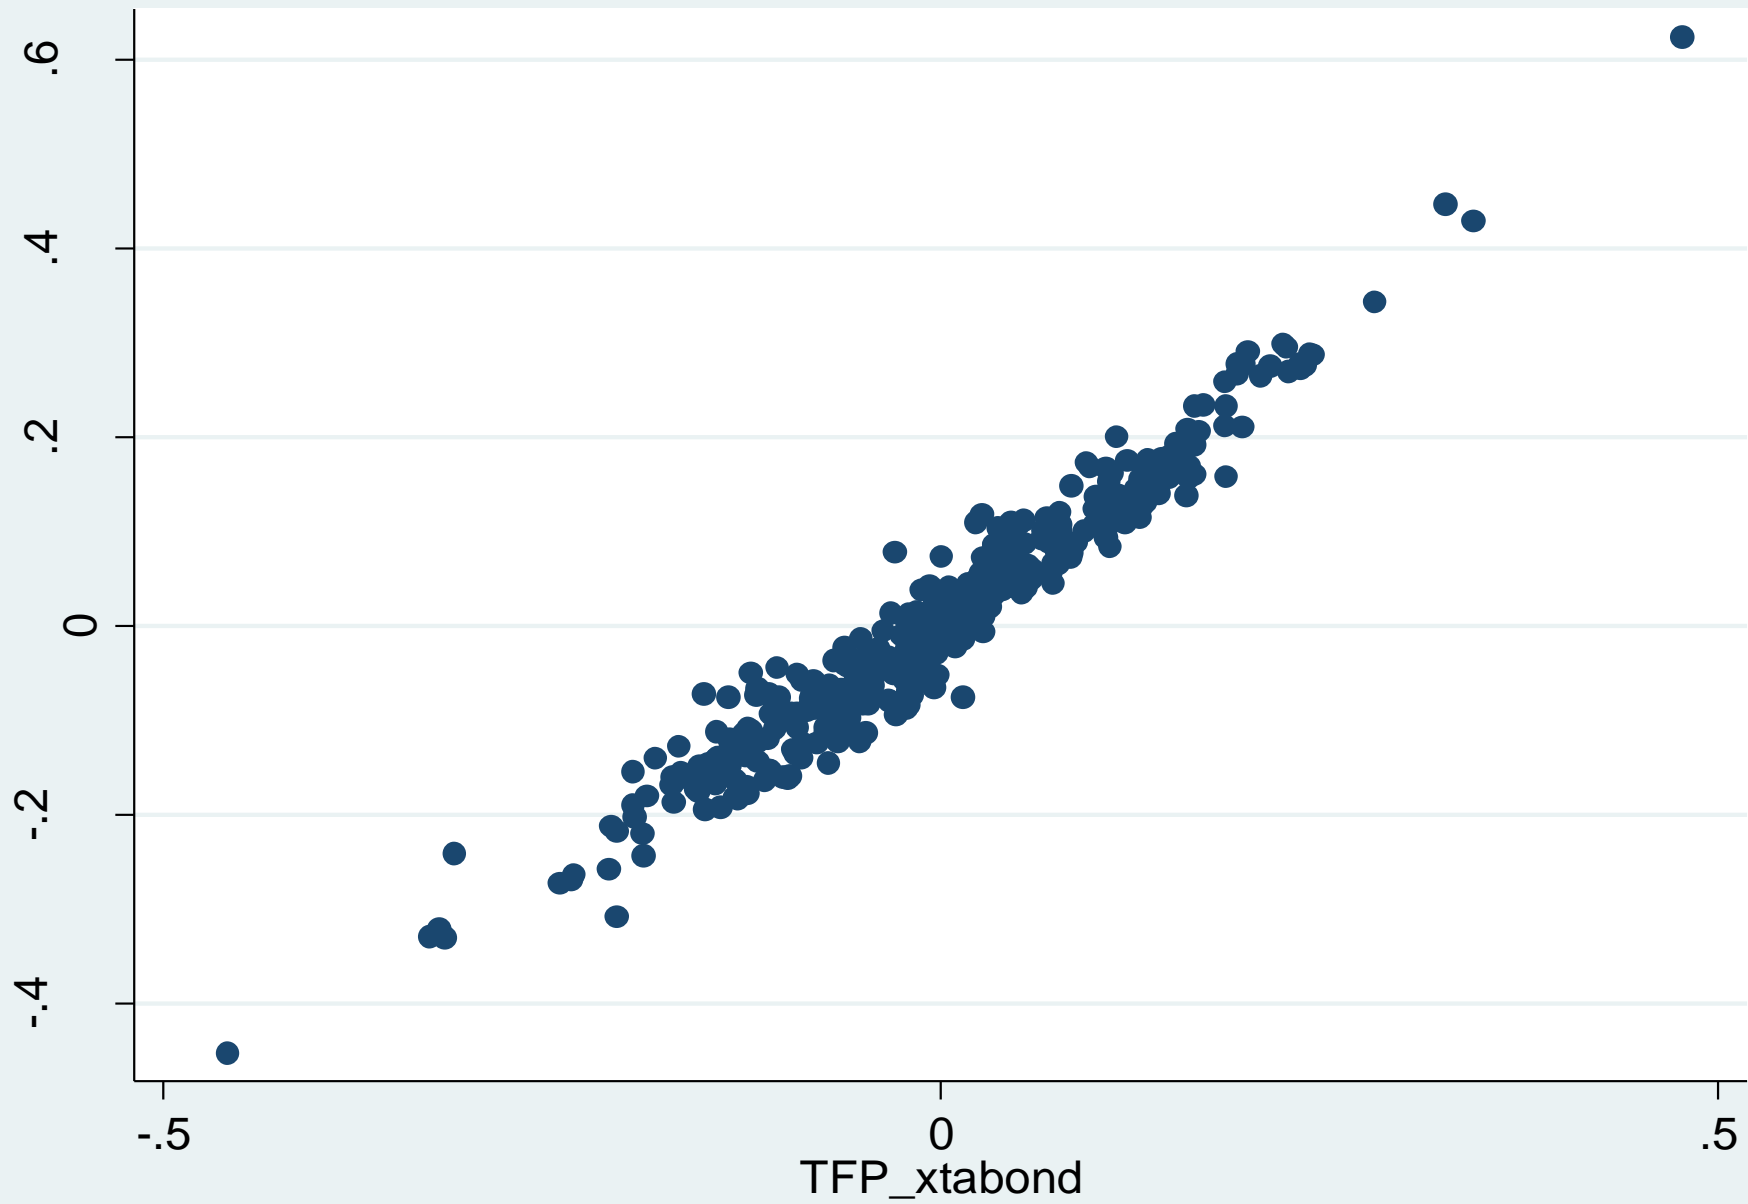

- Examine an untouched channel (networks) in the context of PTM

- Other projects using this data
 - Pre-export investment (i.e., tangibles & intangibles)

 - Pre-export & post-export productivity/profitability dynamics

 - Utilizing network information more intensively

Appendix

List to do for PTM paper

- ❑ Extensive margin & Urgency explanation (e.g., Nakamura)
- ❑ Downstream integration into cloth production
- ❑ Within-effect vs., between-effect
- ❑ Sources of data attrition
- ❑ Financial friction explanation: $BOJ * B/S$
- ❑ Way to demean (e.g., industry average)
- ❑ Domestic price dynamics of exporter and non-exporter firms
- ❑ Time-fixed effect (subsuming ER etc.)
- ❑ Benchmarking export prices by domestic (or industry) prices of cotton yarn produce by firms little depending on Chinese raw cotton
- ❑ Driver(s) of gold/silver rate (for ensuring exogeneity of ER)
- ❑ Controlling for FDI
- ❑ Lagged & averaged ER (related to delivery cost)
- ❑ Heterogeneity in cost adjustment
- ❑ Behavior of Chinese cotton producers
- ❑ Export price volatility within month
- ❑ Determinants of (i) level of ER and growth of ER ?
- ❑ Delivery cost inside China
- ❑ Real Exchange Rate?
- ❑ Magnitude of the ER coef \downarrow (not a one-to-one pass-through, R-squared is also much higher)
- ❑ Somewhat surprisingly, the depreciation of yen to shilling (ER_S) led to lower export price (Did India also have a gold standard? That could explain it. How much variation is there?)

Thank you and comments are welcome!
