# **Testing Climate Claims 2021 Update**

**John R. Christy**

**Professor, Atmospheric and Earth Sciences**

**Director, Earth System Science Center**

**The University of Alabama in Huntsville**

***Dealing with Claims about Climate Change in 2021 can be extremely frustrating.***

***We'll look at some claims and test them with evidence to see if there is a "climate crisis."***

**The Theory of Greenhouse  
Warming – detecting a tiny  
influence on a massive  
climate system**

Earth System Energy Flow Rates (1 unit ~ 3.4 W m<sup>-2</sup>) IPCC

# What's happening at the surface?

# What's happening at the surface?

**How do we test a claim that current global warming is significant and that it is caused almost entirely by the extra greenhouse gases that human economies emit as they enhance their wellbeing?**

**To test the claim we must locate a test metric that has the following robust and scientifically defensible characteristics:**

*McKittrick and Christy (2018)*

## The metric should have these characteristics:

***The response is seen in all models as a dominate characteristic***

*Response is not there when extra greenhouse gases are not included (i.e. control and experiment are always different)*

*The metric cannot have been used in the tuning and development of the model*

*Observations should come from multiple, independent sources*

## The metric should have these characteristics:

*The response is seen in all models as a dominate characteristic*

*Response is not there when extra greenhouse gases are not included (i.e. control and experiment are always different)*

*The metric cannot have been used in the tuning and development of the model*

*Observations should come from multiple, independent sources*

## **The metric should have these characteristics:**

*The response is seen in all models as a dominate characteristic*

*Response is not there when extra greenhouse gases are not included (i.e. control and experiment are always different)*

***The metric cannot have been used in the tuning and development of the model***

*Observations should come from multiple, independent sources*

GWPF

# Test Metric: Temperature, Tropical upper troposphere 300-200 hPa (~30k-40k ft)

**How does the claim relate to what "should" be happening in the upper atmosphere in the tropics?**

**Claim (or hypothesis): significant warming should have already occurred here to change our climate.**

# 39 IPCC Climate Model Simulations CMIP6 300-200 hPa Temperature Trend 1979-2019

# 39 IPCC Climate Model Simulations CMIP6 300-200 hPa Temperature Trend 1979-2019

# 5-Year Running Mean of Tropical Temperature CMIP5 Anomalies of 300-200 hPa Layer (1979-2019)

# 5-yr Running mean 300-200hPa Tropical Temperature Anomalies

## CMIP-6 (Historical + ssp245 after 2014)

Why do models warm too fast, and vary more wildly than observations?

Likely related to model processes which do not allow enough heat to escape to space (negative feedback) when warming events occur. This is likely related to the distribution of heat trapping clouds and/or water vapor.

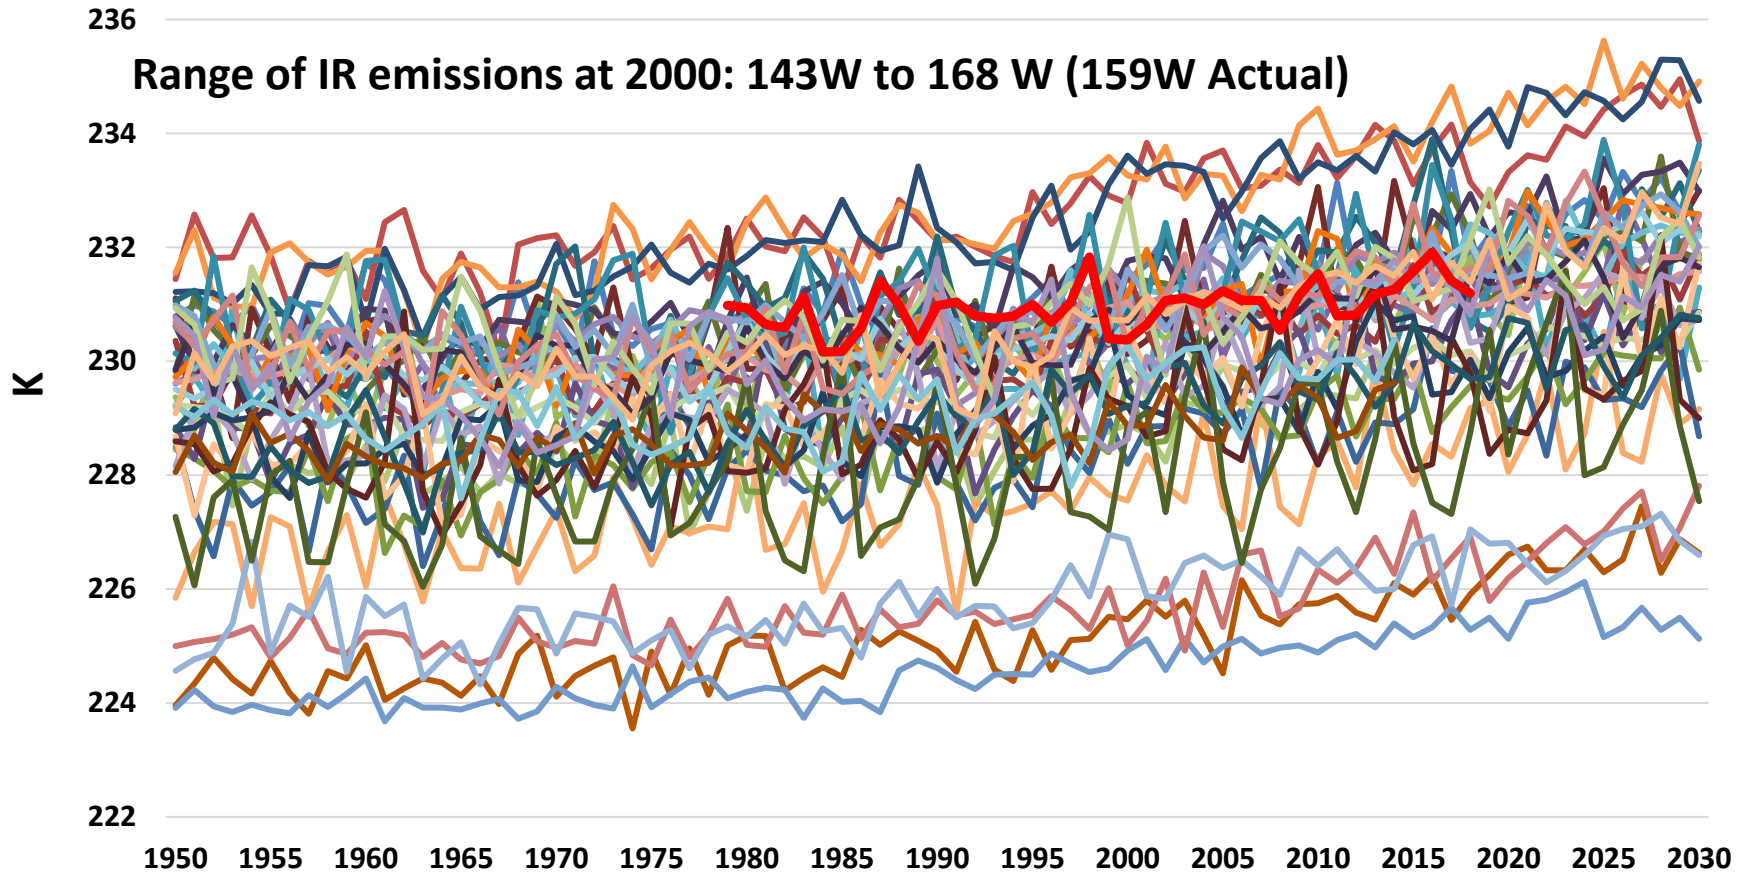

Roy Spencer UAH

Thus, the flow of energy is misrepresented in these hypotheses we call models

# Absolute Temperature 300-200 hPa

Range of IR emissions at 2000: 143W to 168 W (159W Actual)

**Temperature Change 300-200hPa: 1980 - 2100**  
**CMIP-5 Models (102 rcp4.5, 73 rcp8.5)**  
**5-year running averages (base 1979-1983)**

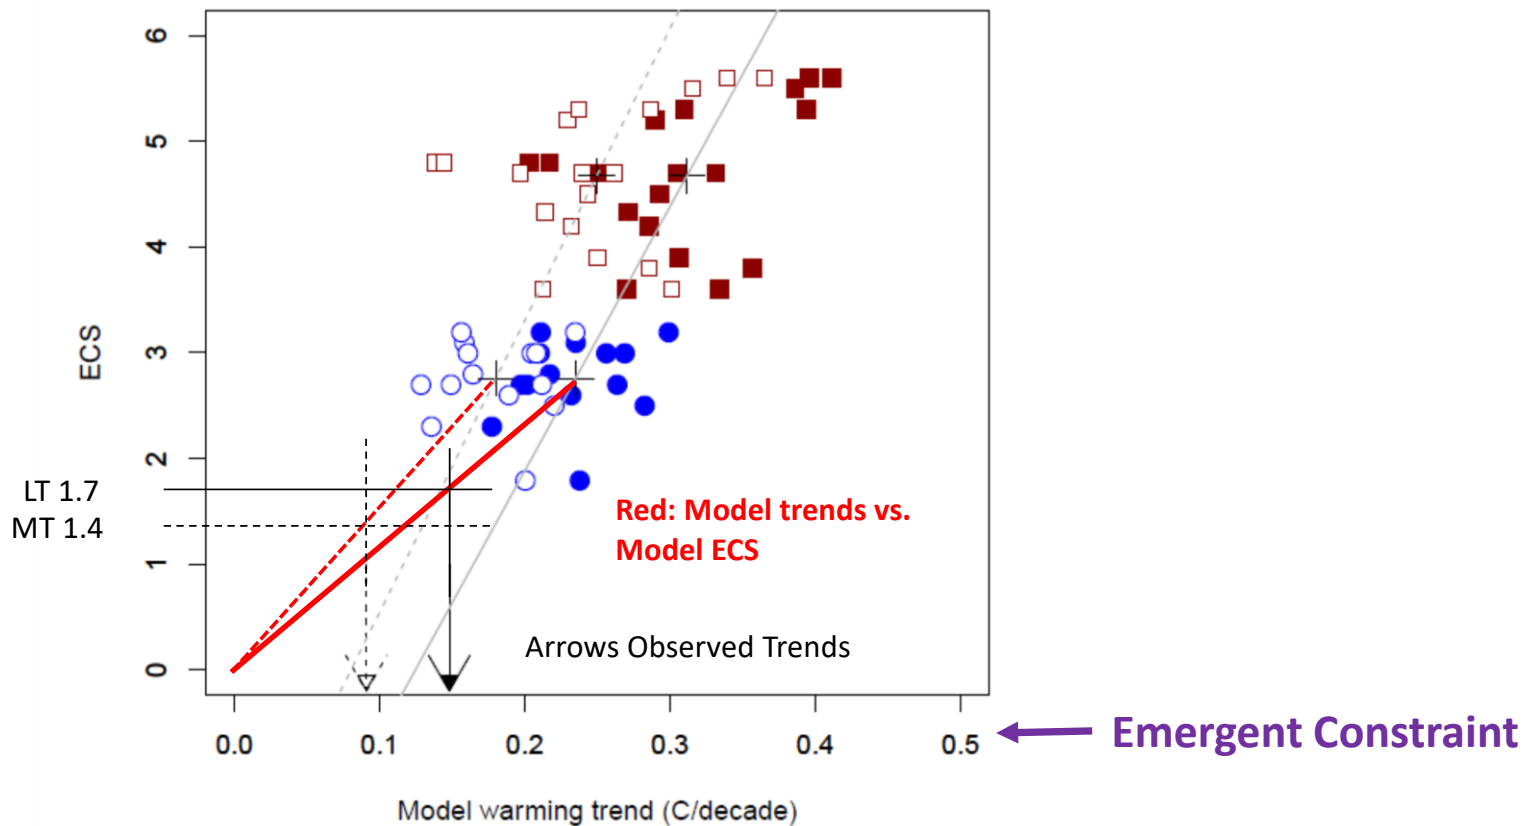

**Equilibrium Climate Sensitivity or ECS, is an index-temperature that allegedly indicates the temperature of the globe after an instantaneous doubling of CO<sub>2</sub>.**

**Latest guestimates from models are 1.8 to 5.6 °C. That is a huge range, so modelers came up with an idea, *Emergent Constraint*, to figure out what the real ECS is.**

**By the way, Empirical (i.e. using real data) estimates of ECS are 1.0 to 2.3 °C, i.e. about half.**

**Emergent Constraint** – a strange term that simply means there are characteristics in the climate system that are somewhat correlated with ECS. For example, if cloud amount is correlated with ECS (ECS is known in models), then cloud amount can be an **Emergent Constraint**. Thus a model with cloud amounts that are realistic would presumably have a realistic ECS. It's a rather round-about way to use tangential metrics to determine which model might have the best ECS when other, more obvious metrics are available.

McKittrick and Christy 2020 used an obvious metric for the **Emergent Constraint** – the temperature trend of the bulk atmosphere.

**Figure 4.** Model ECS values plotted against model warming trends. Red squares: high ECS group; Blue circles: low ECS group. Open shape: MT trend, closed shape: LT trend. Inverted triangle: mean observed LT trend (solid), mean observed MT trend (open).

This plot shows the relationship between global atmospheric trends (**Emergent Constraint**) and ECS from the models. The actual global trends (dashed arrows for mid-troposphere, solid for lower troposphere) suggest the ECS is around 1.4 to 1.7 °C – below the range of the CMIP-6 models. This implies models are too sensitive to greenhouse gases.

**Models represent the level of understanding (or misunderstanding) scientists have about the impact of extra greenhouse gases on the climate. As Hypotheses, do they succeed in describing the attributes of the physical climate so well as to Determine Policy?**

**Models fail to reproduce the past**

**Models fail to reproduce accurate energy flows**

**Models disagree with each other about the future**

**The weather people really care about is not becoming more extreme or dangerous (and, people are getting smarter every day in dealing with weather problems).**

**California exceeds 4 million acres burned by wildfires in 2020**

More than 8,200 fires have consumed more than double the previous record, fire officials said.

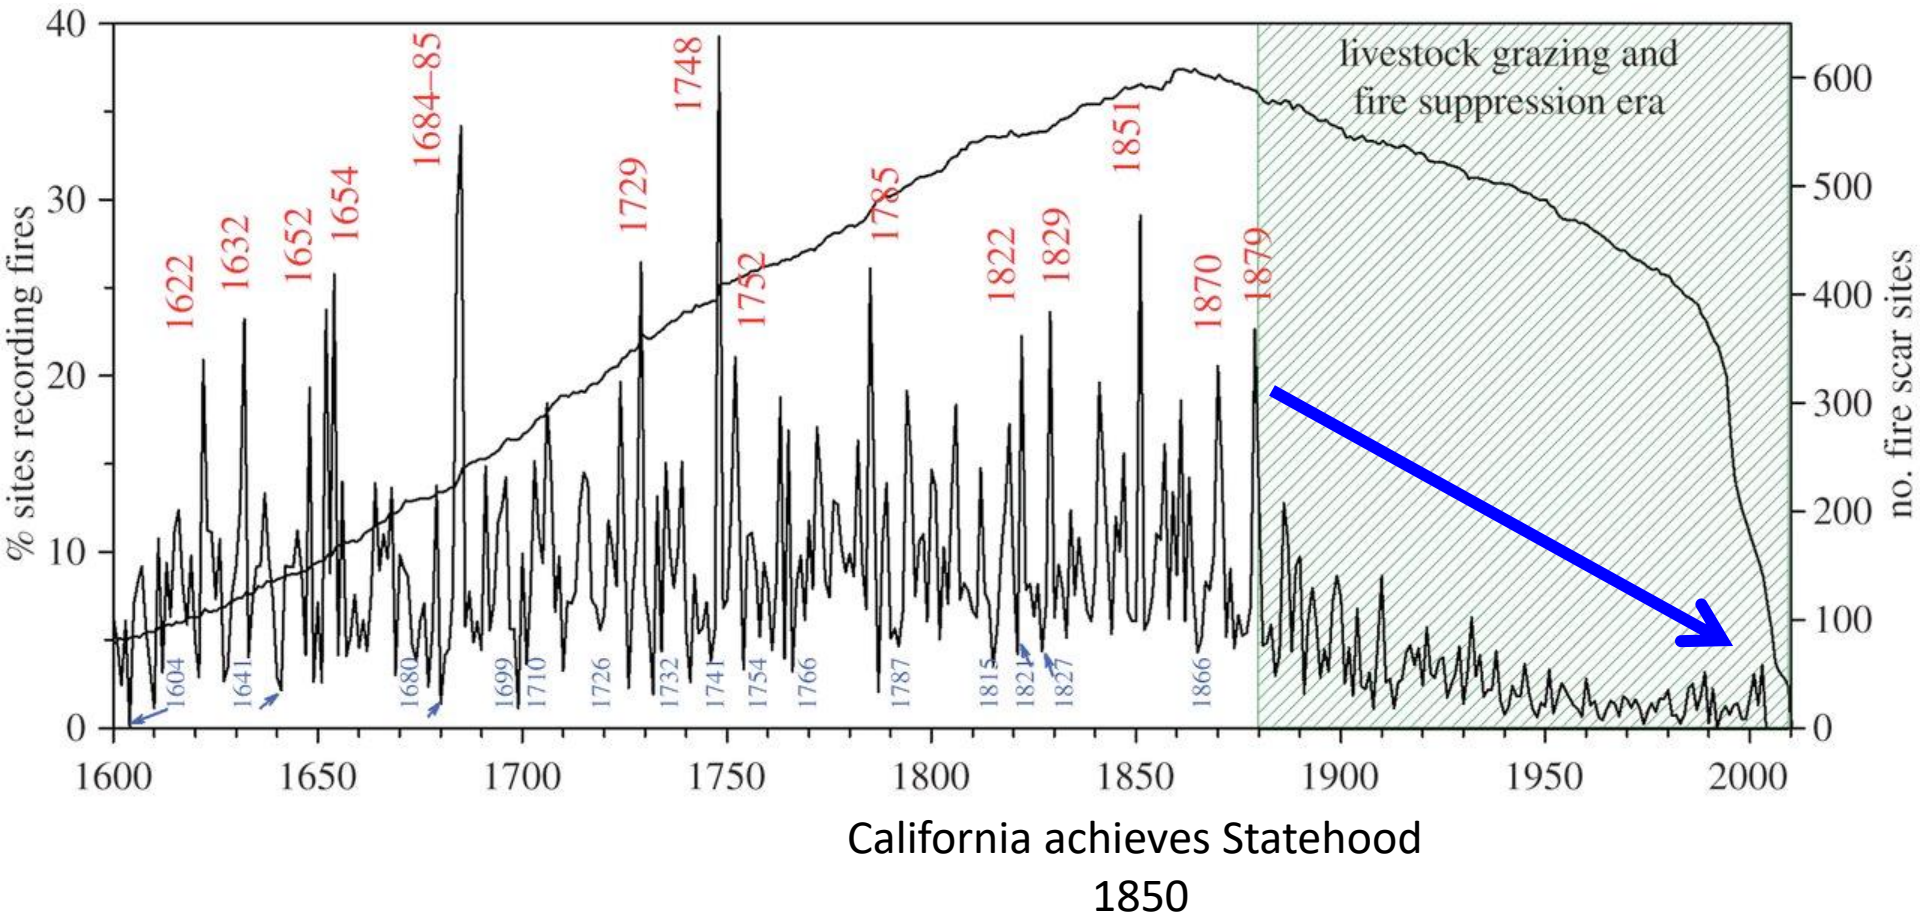

**Record Torched: 2020 California Wildfires Have Burned More Than 4 Million Acres**

**Los Angeles Times**

California fire season shatters record with more than 4 million acres burned

# Incidence in wildfires in North America 1600-2000 (It's all about human management)

Swetnam et al. 2016 Phil Trans B

Marking my property line in Fresno Co. This is 4 miles from southern border of Creek Fire.

California was subjected to annual burns by Native Americans or Mother Nature prior to Spanish settlement. ***Pre-European burn area was 4.5 to 12 million acres in CA per year (Stephens et al. 2007.)***

Subsequent settlers practiced “fire suppression” from the late 19<sup>th</sup>, through the 20<sup>th</sup> and 21<sup>st</sup> centuries as public policy. Significant human occupation of and access to formerly natural landscapes. Dry, unburned fuel load rose dramatically.

***2020 CA acreage burned was under 4.5 million acres.*** Set up by (1) 2012-2015 drought, (2) weakening forests, (3) bark-beetles killed ~150 million trees left to stand (80% in areas). No harvesting allowed of dead trees creating a massive fuel debt to be burned ... 2020 took care of some of that debt.

## Global Burned Area 1901-2018

Bjorn Lomborg

1901-2007 from <https://agupubs.onlinelibrary.wiley.com/doi/abs/10.1002/2013JG002532>, 1997-2016 from <http://globalfiredata.org/analysis.html>, and 2017-18 from <https://gwis.jrc.ec.europa.eu/static/gwis.statistics.portal/countries-estimates/NA>. While estimates of global burned area attempt to be internally consistent, they differ in scope, hence data here shown as difference from 2000-7. Model estimate for that period is 3.63Mkm<sup>2</sup>, satellite estimate for period is 4.88Mkm<sup>2</sup>. [twitter.com/bjornlomborg](https://twitter.com/bjornlomborg)

# Sea Level (albedo proxy)

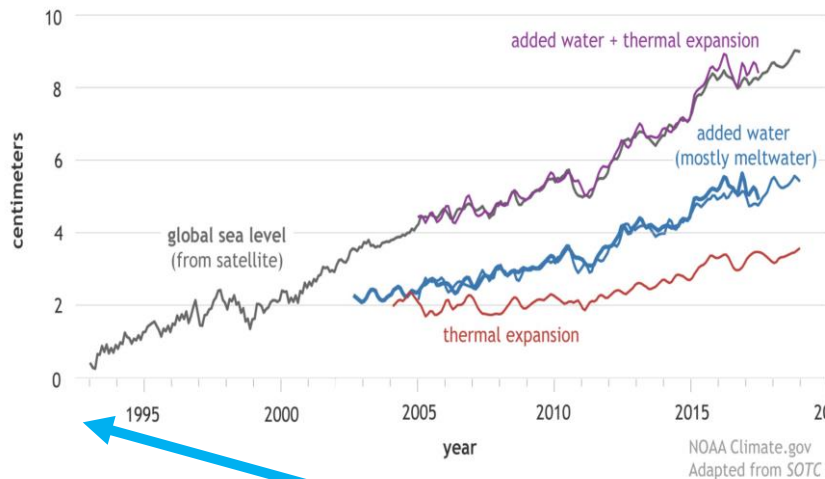

## Post-Glacial Sea Level Rise

## Global Mean Sea Level (6000 BC to Present)

Contributors to global sea level rise (1993-2018)

*Sea Level (Previous Slide)  
2-3m higher 7,000 yrs ago  
6-9m higher 130,000 yrs ago  
10-25m higher 3M yrs ago*

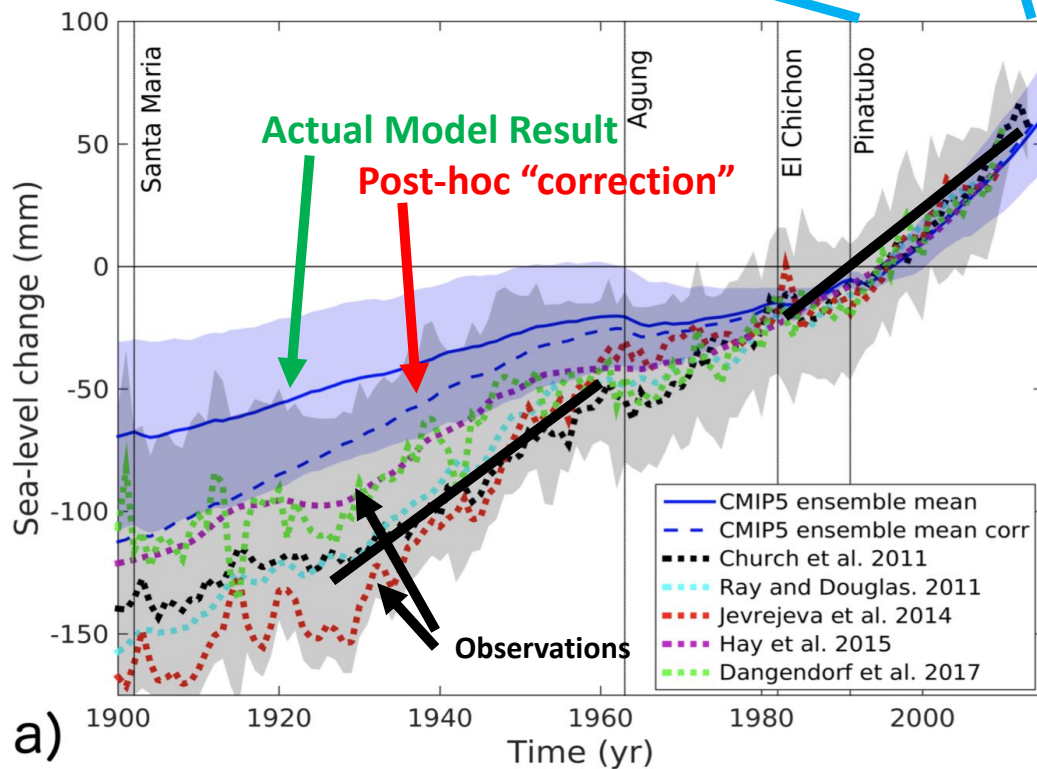

*Glaciers largest extent in past  
10,000 years ~1850, likely lowest  
sea level in that period*

*Sea Levels started rising in 1860  
and continued to present*

*Rate 1925-1960 similar to 1980-  
2018.*

*70% of current rise due to added  
water with thermal expansion 25%*

*CMIP5 models unable, even after  
post-hoc "corrections," to reproduce  
the early SLR.*

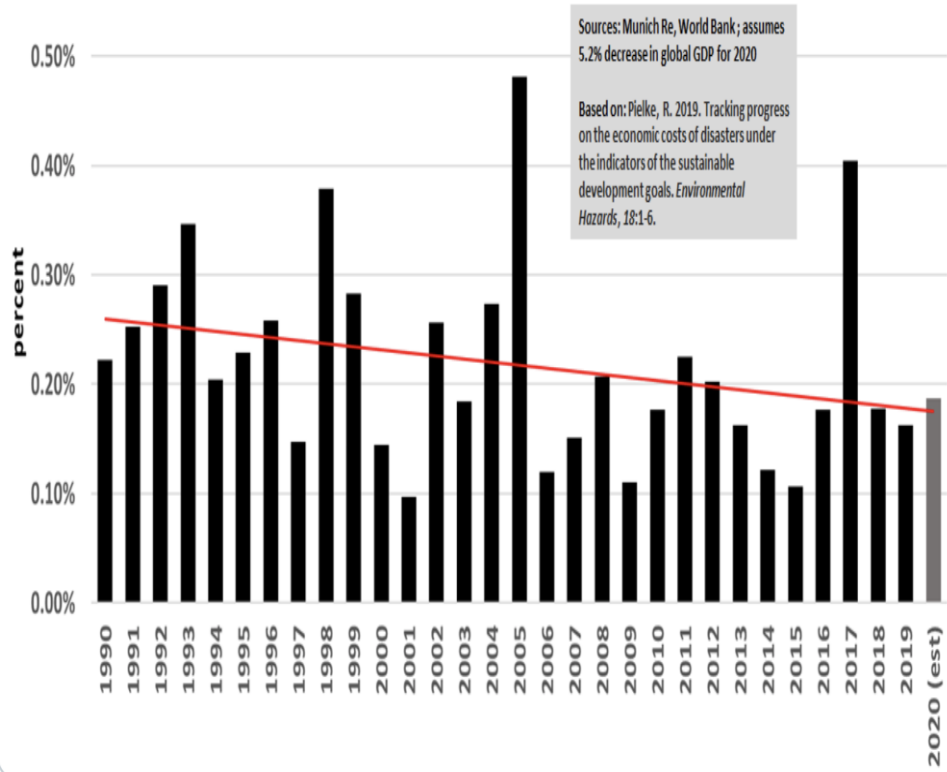

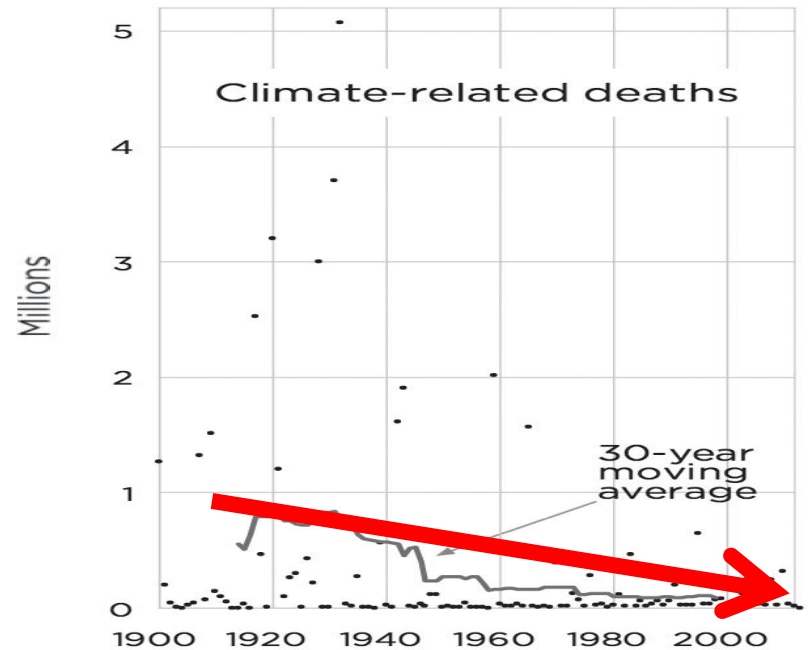

# The last century's warming has been good for Humanity

## Global Weather Losses as Percent of Global GDP: 1990-2020

(2020 losses are 1H annualized, based on average proportion of 1H to full year)

## Global Deaths from Climate and non-Climate Catastrophes, 1920-2018

**Progress toward eradicating poverty based on accessible and affordable energy (which is carbon today) will continue**

***“The Chinese lifted 400 million people out of poverty by building a coal-fired power plant every week.”***

Viewed as bad by the very wealthy environmental activist who said it

Viewed as good by the 400 million human beings no longer living in poverty (and many more millions who strive to end poverty)

*“The Chinese lifted 400 million people out of poverty by building a coal-fired power plant every week.”*

**Viewed as bad by the very wealthy environmental activist who said it**

Viewed as good by the 400 million human beings no longer living in poverty (and many more millions who strive to end poverty)

*“The Chinese lifted 400 million people out of poverty by building a coal-fired power plant every week.”*

Viewed as **bad** by the very wealthy environmental activist who said it

Viewed as **good** by the 400 million human beings no longer living in poverty (and many more millions who strive to end poverty)

**In 2020, China’s coal use rose to highest since 2015 (Reuters)**

**... and with record cold temperatures in parts of China in early 2021, many windmills were idled – too much ice on blades.**

*“The Chinese lifted 400 million people out of poverty by building a coal-fired power plant every week.”*

Viewed as **bad** by the very wealthy environmental activist who said this

Viewed as **good** by the 400 million human beings no longer living in poverty (and many more millions who strive to end poverty)

**An undeniable force:  
No one wants to be poor.**

*The evidence from actual data: The drive to live a longer and better life is preferable to succumbing to the constraints of environmental virtue.*

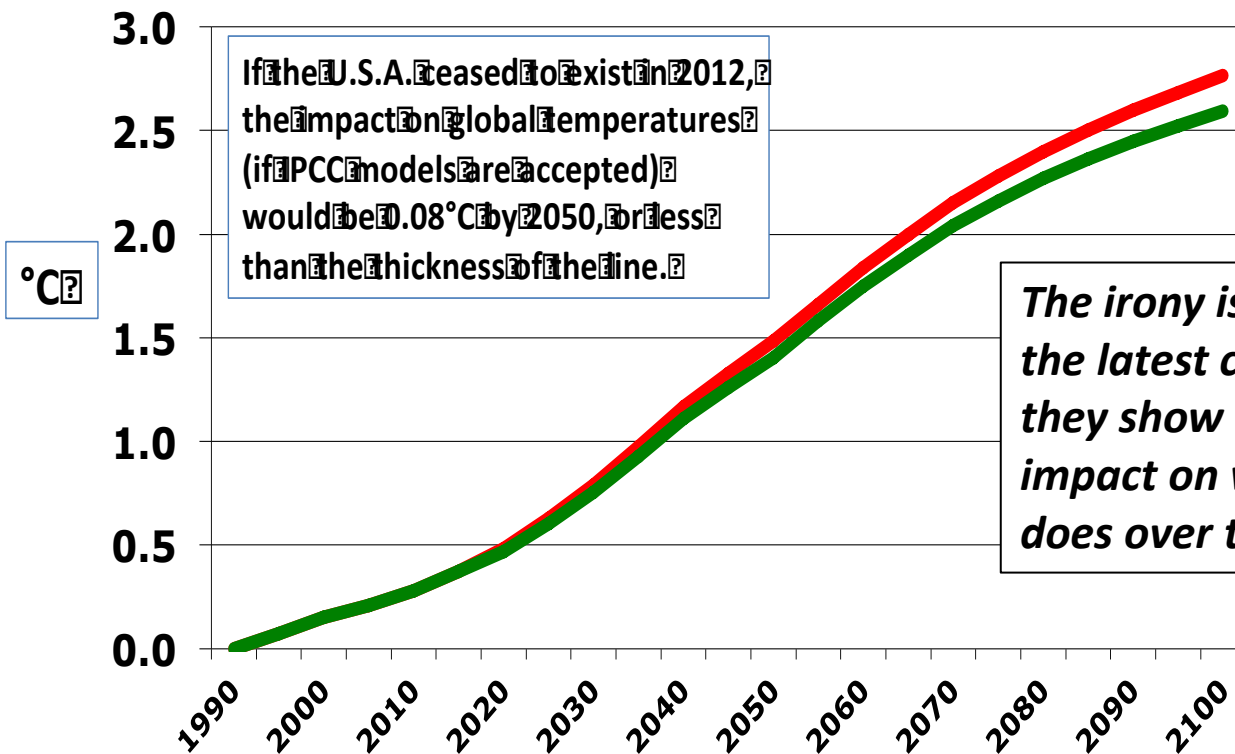

*Without Energy Life is Brutal and Short*

# Will CO2 regulations “save” the planet?

Red - Temperature PCC A1B Emissions

Green - U.S. stops all emissions 2012

If the U.S.A. ceased to exist in 2012, the impact on global temperatures (if PCC models are accepted) would be 0.08°C by 2050, or less than the thickness of the line.

No

*The irony is that even if you accept the latest climate model simulations, they show that the US will have little impact on whatever the temperature does over the next century*

Data from SPPI, Paul Knappenberger

# Three points the evidence supports:

1. The Established Global Warming Theory *significantly* misrepresents the impact of extra Greenhouse Gases.

2. The weather that affects people the most is not becoming more extreme or dangerous

3. Progress toward eradicating poverty based on accessible and affordable energy (which is carbon today) is continuing.

***(2019) The average American is smarter than you think – they recognize it when an elitist is exaggerating a story, the end result of which is to deny this average guy some aspect of life he/she wants and needs (while the elitist maintains a luxurious lifestyle).***

***(2021). The average American is going to learn what a political party who wants to eliminate carbon usage is going to mean for their lives. However, if re-election is still a main driving force, perhaps this party will look for hard evidence to find excuses for not punishing the electorate with higher and higher energy prices.***

**Demonstrating that claims of climate campaigners are exaggerated or false ensures isolation, denigration and criticism from the climate establishment and major media ... and in 2021 the elected federal government now joins in.**

**The facts don't seem to matter to them.**

*Is this the "Science Way"?*

*36 hours after "March For Science" with emphasis on climate change, 7 rounds were fired into my building/office suite.*

**Thank You**
